Overview

In this project, we aim to design a community-driven website that provides a platform for developers, programmers, IT professionals, and students to ask and answer technical questions related to software development and programming.

The name of our website is BugSearch. The website features a user-friendly interface where users can ask questions, post answers, and interact with other users. The site has a vast library of questions and answers that cover a wide range of programming topics, including programming languages, software frameworks, development tools, and many more.

Overall, BugSearch is a great place for developers to find answers to technical questions, share knowledge, and build their online reputation in the programming community. Its user-friendly interface, tagging system, and interactive platform make it an essential tool for developers at all levels of expertise.

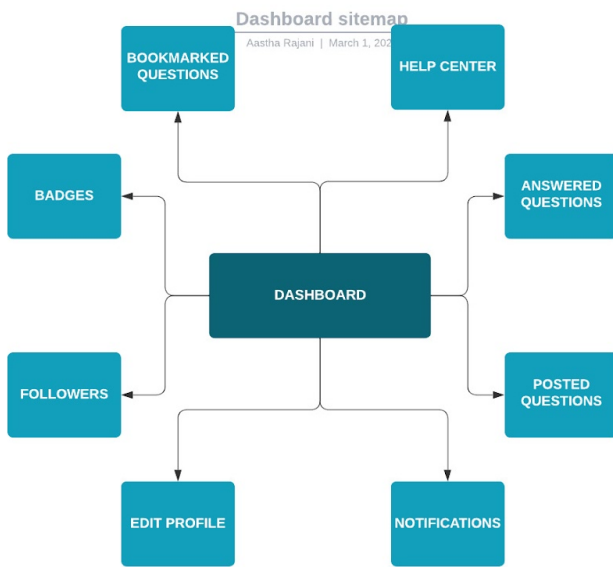

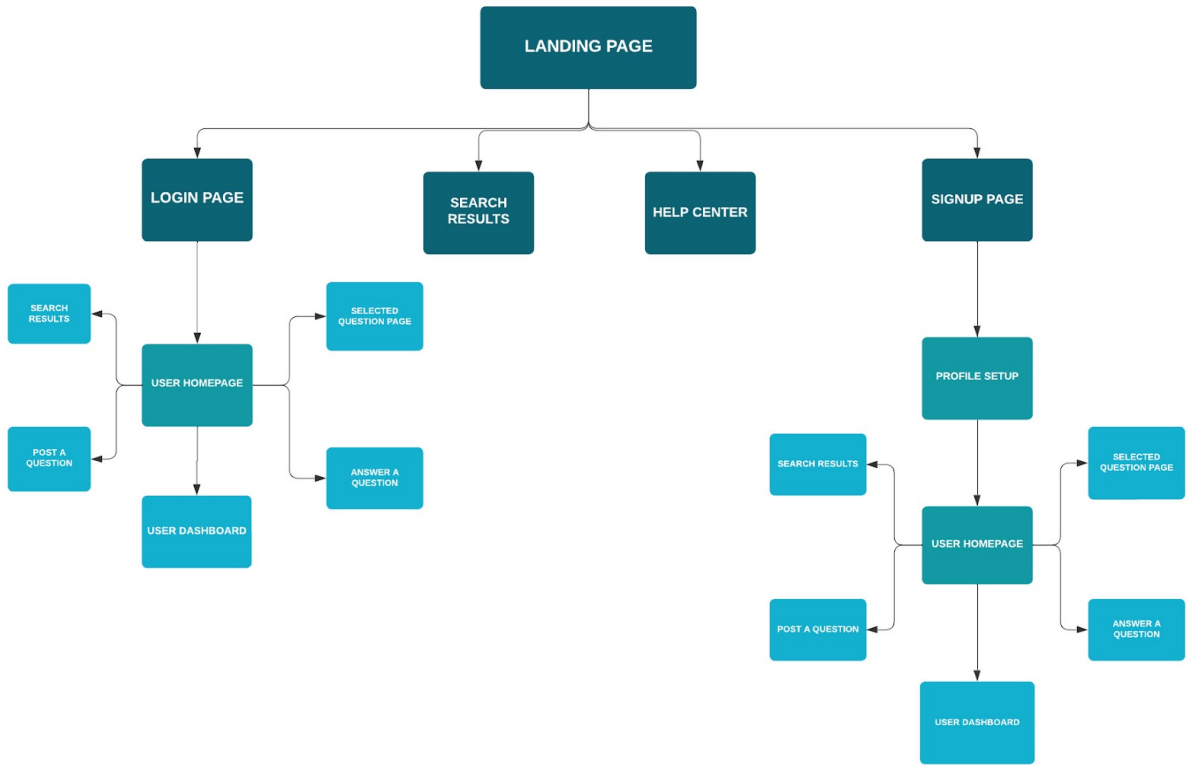

Dataset

We have obtained a comprehensive dataset of the Stack Overflow website from Kaggle, containing a vast collection of questions, answers, and user interactions. Our team wants to use this dataset to make a similar website for a niche audience. The dataset will serve as a valuable resource for understanding user behaviour and preferences, enabling us to provide customised solutions and improve the overall user experience on our website.

Below is the link for it:

https://www.kaggle.com/datasets/stackoverflow/stackoverflow?select=posts_links

Functionalities

Our website includes several features that help promote a healthy and active community, such as a reputation system, a voting system, badges, and question threads. In this response, we will explore some of the key features of BugSearch in more detail.

1. User Accounts-

Users can create accounts to ask and answer questions, as well as to vote on the quality of answers.

2. Voting System-

Users can upvote or downvote answers, which helps bring the best content to the top and gets rid of low-quality posts. And it will form the basis for ranking the answers.

Points are allotted for different purposes in order to encourage community participation:

- A. posting a question: 2
- B. having a question upvoted: 2
- C. giving an upvote to a question: 2
- D. Having an answer upvoted: 10
- E. An answer got accepted by the user who posted question: 15
- F. Answer downvoted: -2
- G. Giving a downvote: -2

Note: You must have at least 30 reputation points if you want to upvote or downvote an answer or question. You can't upvote or downvote your questions or answers.

3. Tags-

Users can tag questions with relevant keywords while posting, making them easier to find and answer.

4. Searching for a question-

Users can enter keywords or phrases related to the question they are looking for and then click the “Search” button to see a list of relevant results.

5. Posting Questions-

- Users should be logged in to post a question.
- Users should associate the question with appropriate tags.
- Could upvote/downvote questions.
- Questions may contain text/images.
- Add comments to specific questions.

6. Posting Answers-

- Users are required to be logged in to post answers.
- Multiple answers could be associated with a question.
- Users may upvote/downvote an answer.
- Users can post a single answer to any particular question.
- Users may add comments to a particular question thread.

7. Badges-

BugSearch rewards users for achieving certain milestones or demonstrating certain skills with badges. This could be considered a direct measure of the user's contribution to the website.

8. Reputation System-

Users are rewarded reputation points for providing useful answers and participating in the community. This system helps to encourage quality answers and discourage spam.

9. User feed-

This is a personalized feed that shows the user's recent activity on the site, including recently posted questions related to the user's interests.

10. Bookmark-

Users are allowed to bookmark any post for future reference, and they will be notified when they get an answer.

11. User's Dashboard-

This page shows the user's reputation points and badges, the number of questions they've answered so far, questions they've saved, the number of people who follow them, and notifications about the status of questions they've posted. Additionally, it also displays profile editing options.

12. Help Center-

This part of the website would be for giving users the information and tools they need to use the site well.
